Dear Hiring Manager,

I am a Backend Java Engineer with over five years of experience building and operating scalable backend systems in distributed production environments. Based in Berlin, I am currently looking to bring my experience in Java, microservices, and system reliability to a strong engineering team where I can continue growing as a mid-level backend engineer.

Most recently, I worked as a Software Engineer for a PropTech venture focused on the Dubai market, where I developed backend services and REST APIs using Java and Spring Boot for a web-based real estate platform. My work included implementing features for property listings, search functionality, user accounts, database integrations, and supporting deployment workflows in a fast-moving product environment.

Before that, at Promos in Berlin, I worked on Java and Spring-based backend services within distributed architectures. A key part of my role involved diagnosing and resolving production issues, as well as improving observability using OpenTelemetry and Jaeger to enable faster debugging and more reliable systems.

Previously at CGI, I developed and maintained backend systems for telecommunications clients, where I implemented REST APIs, worked on microservices architectures, and contributed to event-driven solutions using RabbitMQ. I also supported workflow automation projects using Camunda in complex business environments.

What I enjoy most in backend engineering is working on real production systems: understanding how services interact, solving complex technical issues, and continuously improving performance, stability, and maintainability.

I would welcome the opportunity to discuss how I can contribute to your backend systems and support your engineering team. Thank you for your time and consideration.

Sincerely,

Felix Behboudi
